御杖村プロジェクト概要 / Mitsue Village Project — Summary

One-Page Briefing for Mitsue Village Government

April 2026

What We Propose

To repurpose the closed **Mitsue Elementary School** (御杖小学校) as a **community sustainability center** that will:

1. Restore aging cedar (sugi) plantations to healthy native forest
2. Generate clean local energy from harvested cedar (biomass and biogas)
3. House a small, low-impact data center powered by that local energy

A 25-year initiative built carefully, in close partnership with the village.

Direct Benefits to Mitsue Village

- **Local employment** — forestry work, facility operations, maintenance roles
- **Income for landowners** — fair compensation to private mountain owners for sugi harvesting
- **Lower energy costs** — locally generated power for the village
- **EV charging infrastructure** — Mitsue prepared for the coming shift to electric vehicles
- **New use for the closed school** — preserving and honoring an important community building
- **Reduced cedar pollen** — gradual replacement of sugi with native species over decades
- **Broadband and digital infrastructure** — improved connectivity for residents and businesses
- **National and international visibility** — Mitsue as a model village for sustainable rural revitalization

---

What We Are Asking For

At this early stage, we are seeking:

- An **opportunity to discuss** the project with village leadership
- Guidance on how to engage the **community (自治会) and residents** appropriately

- **A letter of interest** to support our application for initial feasibility study funding

We are **not** asking for village funds at this stage.

How the Project Will Be Organized

A dedicated **non-profit organization (NPO法人)** will be established to coordinate the project. The NPO will work transparently with:

- Mitsue Village Government
- Local residents and community associations (自治会)
- Private forest landowners
- Forestry contractors
- Nara Prefecture and national agencies (林野庁, METI)
- Academic and technical partners

Who We Are

Rob Oudendijk — Dutch electrical engineer, Mitsue resident since 2012 (Sugano), core hardware developer for Safecast (the global citizen science radiation monitoring network).

Advisors:

- **Joi Ito** (former Director, MIT Media Lab)
- **Ray Ozzie** (software pioneer, former Microsoft Chief Software Architect)

The project has also received interest from the **Consul-General of the Kingdom of the Netherlands in Osaka, Ms. Sandra Pellegrom**, as an example of Dutch-Japanese sustainable collaboration.

Our Approach

- **Local first.** Mitsue residents and landowners are the foundation of this project.
- **No surprises.** We will share information openly and seek guidance at every step.
- **Patient and modest.** We are building for 25 years, not for headlines.
- **Replicable.** What we learn in Mitsue will be shared so other villages can benefit.

Next Step

We respectfully request a meeting with village leadership at their convenience to discuss the project and listen to your guidance.

Rob Oudendijk

Sugano, Mitsue Village, Nara Prefecture
