Meeting: **Aug 5, 11:00–12:00**
Counterpart: **Nao Uesaka**, Mizuho Securities
Status: **Draft for discussion** · v0.1

Entity Structure — Option B

OPTION B · THREE PILLARS

Option A's non-profit + for-profit, plus a **member-owned cooperative** as a third pillar. Since much of the forest is privately owned (not a commons), a cooperative pools the fragmented parcels, gives owner-members a revenue stake, and becomes the fuel-supply layer — solving ownership and supply security in one entity.

STRUCTURE 三つの法人格

NON-PROFIT

Mission arm

NPO法人 / 一般社団法人

Reforestation & community
Owns species choice, replanting, eco-tourism, MRV & forest J-Credit. Partner: **more trees**.

COOPERATIVE

Supply arm

生産森林組合 / 農事組合法人

Owner-member forest co-op
Pools private parcels; plants & tends (per non-profit's species choice); owns + runs the 牛峠工場 fuel chipper; supplies fuel-wood; **members share revenue pro-rata**. Sub-variant: formalize 御杖村森林組合 vs. a new co-op.

FOR-PROFIT

Operating company

株式会社 / 合同会社

Revenue assets
Biomass CHP + AI data center. Balance sheet & repayment capacity → the vehicle Mizuho finances (debt, bonds, SLL, equity).

Harvest-funds-replant loop — operating surplus → non-profit (the more trees split); the co-op is paid for fuel-wood, so the for-profit side cannot starve the forest

HOW VALUE MOVES 資金の流れ

FLOW	MOVEMENT
Owners → co-op	Private forest owners join the **cooperative**, pooling fragmented parcels into one negotiable supply block; owner-members **share fuel-wood & land-lease revenue pro-rata** — a profit stake the non-profit legally can't offer them.
Co-op → fuel	The co-op chips and dries thinnings (間伐材) at its existing **牛峠工場**; a **subsidy-funded fuel-grade chipper** (P31S–P45, <20%) is co-op-owned. *Chipper spec & drying moisture to confirm.*
Co-op → operating co.	Fuel-wood sold to the operating company on a **long-term offtake contract** (fixed volume + price) — the supply security behind the CHP's repayment capacity.
CHP → compute	Heat + power run the data center; surplus power can PPA to the onsen / village.
Revenue → mission	Operating surplus flows to the non-profit as the **harvest-funds-replant loop**.
Subsidies 補助金	**DC / power** (METI GX地域共創, MoE zero-emission) → operating company; **forest / RE 交付金** → non-profit; **fuel-chipper & forestry grants** → the co-op.
Mizuho finance	Bond / SLL / equity to the operating company; grant & impact advisory to the non-profit; the co-op locks supply.

WHAT TO PUT TO NAO-SAN

"Much of the forest is privately owned, so we're weighing a member-owned cooperative that pools parcels and contracts fuel-wood to the operating company. From a financing view — does a cooperative supply layer strengthen or complicate the operating company's fuel-supply security, collateral, and J-Credit ownership when you structure debt / SLL? Would you rather see supply locked by long-term offtake contracts than by a membership tie?"

Trade-off: a third legal entity solves the ownership problem (private land ≠ commons) but adds inter-entity contracts lenders discount. Expect her to favour contractual offtake over a new wrapper — in which case Option A + a supply contract may beat Option B.

Draft for discussion — not a committed structure. Funding is pipeline / target; ¥0 committed as of 2026-07. Confirm co-op form, tax & subsidy eligibility with a Japanese 税理士 / 司法書士 before filing. 牛峠工場 chipper spec & drying unverified — confirm with 御杖村森林組合 (0745-95-2410).
