My notes: Yamauchi (SANSEI), Thu 22 Oct 12:00, KRP2 2F-201

Sugimoto's view (OK to pass on, reference only, his land = his call)

- Kiri alone: no (diversity). Mixed with broadleaf/sugi: fine
- Grows on deer clear-cuts, fast, soil OK. **5-yr harvest: unknown**
- Big trees ~300 m sunny; ~1,000 m dies out. **No kiri buyer in Kinki**
- Biomass fuel: he says unsuitable (light wood). Our data: ~6% less energy per kg than sugi, ~35% less per m³ (more hauling/storage). Usable, not poor
- Pioneer: shade-tolerant trees take over. Short-lived. No hard evidence

Ask

- Buyer at year 5?
- Deer / bear / frost protection?
- Kiri on part only? What grows between after the cut?
- Ureshino (Mie): cut yet? What's there? Kiri planting date?
- **26 Oct:** time, place, how many trees, area, seedlings

Pitch / extras

- Flowers edible (vanilla-honey). Needs no spraying: **ask about pesticides**
- South slope kiri, north slope mixed forest
- Tourism: kiri grove + paths, like the Misugi mitsumata colony
- Our line: native broadleaf for wildlife

Bring

- JP one-pager (hand over), business cards, intro A4 sheets, tablet (videos)
- Full 2-language PDF to send later
