

Project Guideline — Aligning the Work with the Vision

This document turns the reflections in [thoughts-clean.md](#) into a set of guiding principles and a concrete list of things to be done. It is a compass, not a contract — when a decision is unclear, come back here and ask: *does this honour the forest, the elders, and the grandchildren?*

Guiding Principles

1. **The forest is the source of the power.** Everything flows from the trees the older generation planted. Energy, compute, memory, and craft all begin in the local forest.
 2. **The elders' knowledge is the payload.** The AI data center exists to store and carry forward the memory and wisdom of the village — not just to sell compute.
 3. **Return education to where it began.** Put learning (and the data center) inside the school, so the grandchildren are taught in the same place their grandparents were.
 4. **Honour foresight across generations.** The young should see and value what the old planted, even though the outcome is not the one the elders first imagined.
 5. **Local hands, local wood, local finance.** Craft (desks, billiard cues, tables) is made from the nearby forest by local makers such as Niwa-san. Fund the work through local finance, not shady outside construction money.
 6. **The "glue" is a real commercial structure.** Feeling and story are not enough — the vision only survives if there is a sound, resilient business and organisational structure underneath it.
 7. **Build for decades, not for an event.** Resilience over spectacle.
-

Things To Be Done

A. Anchor the story (foundation)

- ☐ Adopt [thoughts-clean.md](#) as the canonical vision statement for the project.
- ☐ Write a one-page bilingual (EN/JP) summary of the vision for partners and villagers.
- ☐ Record the elders' stories and wisdom (audio/video) as the first "memory" the data center holds.

B. The forest → power chain

- ☐ Confirm the sustainable wood/thinnings supply from the nearby forest (link to the biomass plan).
- ☐ Map how forest → energy → compute physically connects (site, boiler/CHP, data center location).
- ☐ Define the reforestation commitment so the cycle continues for the next generation.

C. The school / data center

- ☐ Secure agreement to host the local AI data center at (or beside) the school.
- ☐ Design an education programme that uses the data center as a living teaching tool.
- ☐ Confirm power, cooling, and safety requirements for a school-adjacent facility.

D. Local craft

- ☐ Commission local craft from local hinoki, made by Niwa-san / local makers.

E. The team & the "glue"

- ☐ Continue assembling the expert organisation: technology, finance, and human resources.
- ☐ Bring in educational and economic advisers to design a decades-resilient structure.
- ☐ Define the commercial/legal structure (who owns, who operates, how revenue returns locally).

F. Finance

- ☐ Prioritise local finance sources; avoid dependence on outside construction interests.
- ☐ Tie the funding plan back to the project's EVM / budget baseline.

How to use this document

- Review it whenever a new decision, partner, or spend does not obviously fit.
- Update the checklist as items are completed; keep the principles stable.
- If a principle and a practical constraint truly conflict, name the conflict openly and decide deliberately — do not quietly drop a principle.
